

Integration Designer APEX 10.9

Overview

The next generation of programming software for the RTI control system, Integration Designer APEX, takes all the best version 9 and adds more power, flexibility, and efficiency. APEX features auto-programming for common functions, multi-room support, updates to the built-in IR library, customizable drag-n-drop programming, and resizable graphics.

New Features

- Added support for the VXP-82 presentation switcher and all-in-one processor.

For more information on the VXP-82 see the product page on the RTI dealer site [here](#).

- Added a 64-bit version of APEX. This fixes crashes caused by out of memory errors and allows for greatly reduced compile times.

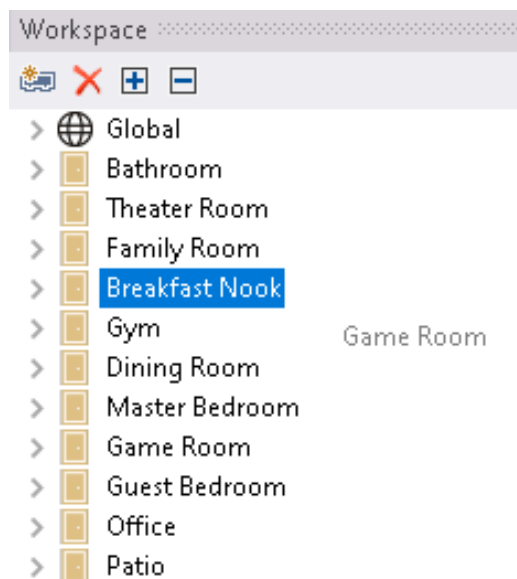

- The download dialog is now shown while the files are compiling. Downloading to some remote controls while others are still compiling is possible.

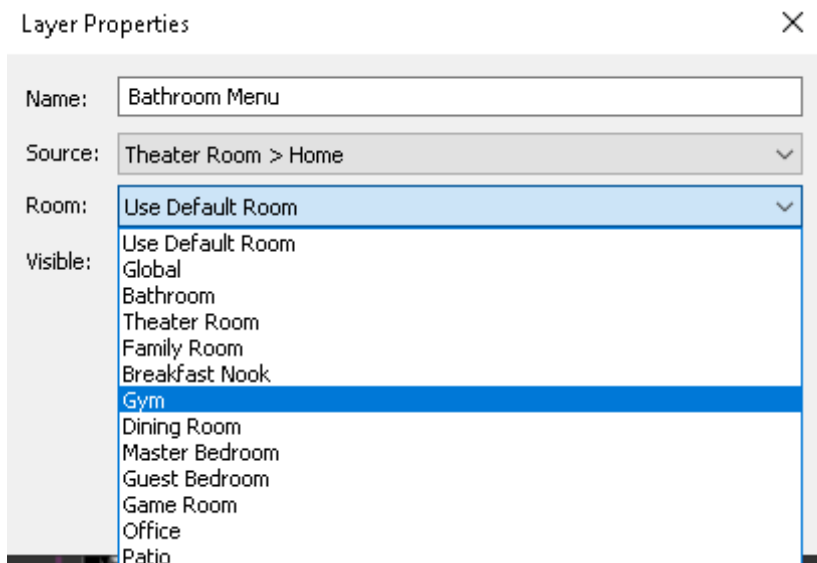

Devices in the current system

Device	Room	Status	Target	Download
 XP-8v	Global	Waiting...	USB	
 T4x	Theater Room	Needs Updating	USB	<button>Send</button>
 KX3	Theater Room	Needs Updating	USB	<button>Send</button>
 CX10	Theater Room	Needs Updating	USB	<button>Send</button>
 KX7	Theater Room	Needs Updating	USB	<button>Send</button>
 KA11	Theater Room	Calculating...	Not Set	
 Theater iPad	Theater Room	Calculating...	Processor	
 iPhone	Theater Room	Calculating...	Processor	

- Rooms can now be re-ordered with drag and drop.

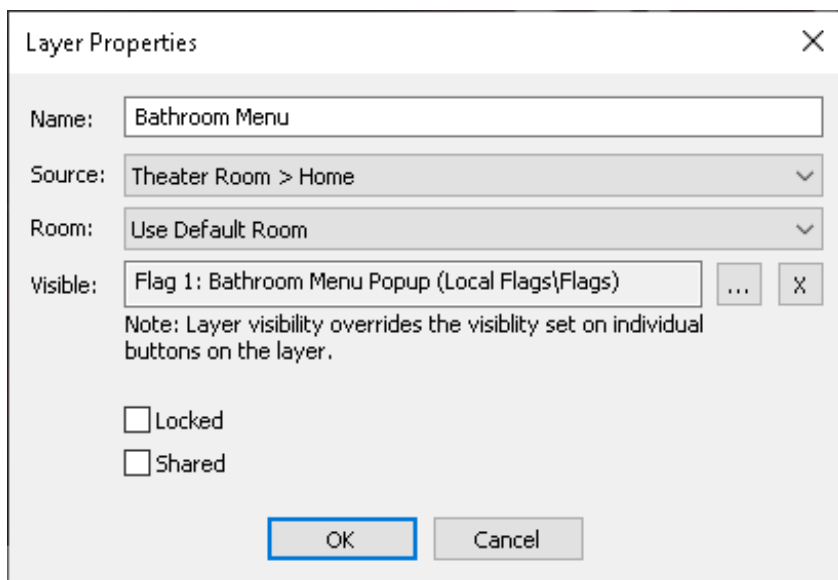

- The Layer properties now have a Room selection option (makes it easier to create a single page that can control things in multiple rooms).

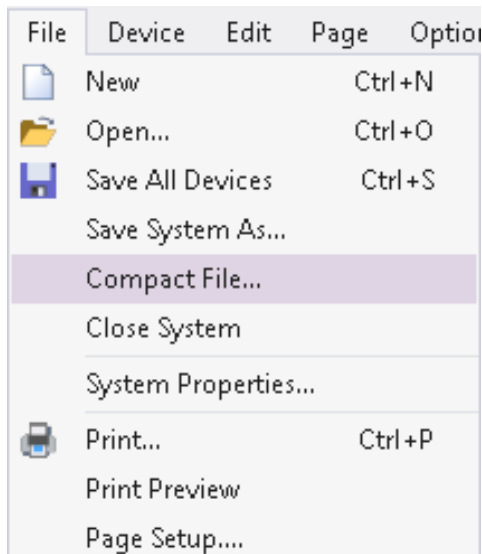

The screenshot shows the 'Layer Properties' dialog box with the 'Room' dropdown menu open. The 'Name' field is 'Bathroom Menu', 'Source' is 'Theater Room > Home', and 'Room' is set to 'Use Default Room'. The dropdown menu lists various rooms: Use Default Room, Global, Bathroom, Theater Room, Family Room, Breakfast Nook, Gym (highlighted), Dining Room, Master Bedroom, Guest Bedroom, Game Room, Office, and Patio.

- The Source selection in the layer properties now has a "Use Default Source" option. This option can be useful for Viewport layers where the Viewport is on a shared layer.

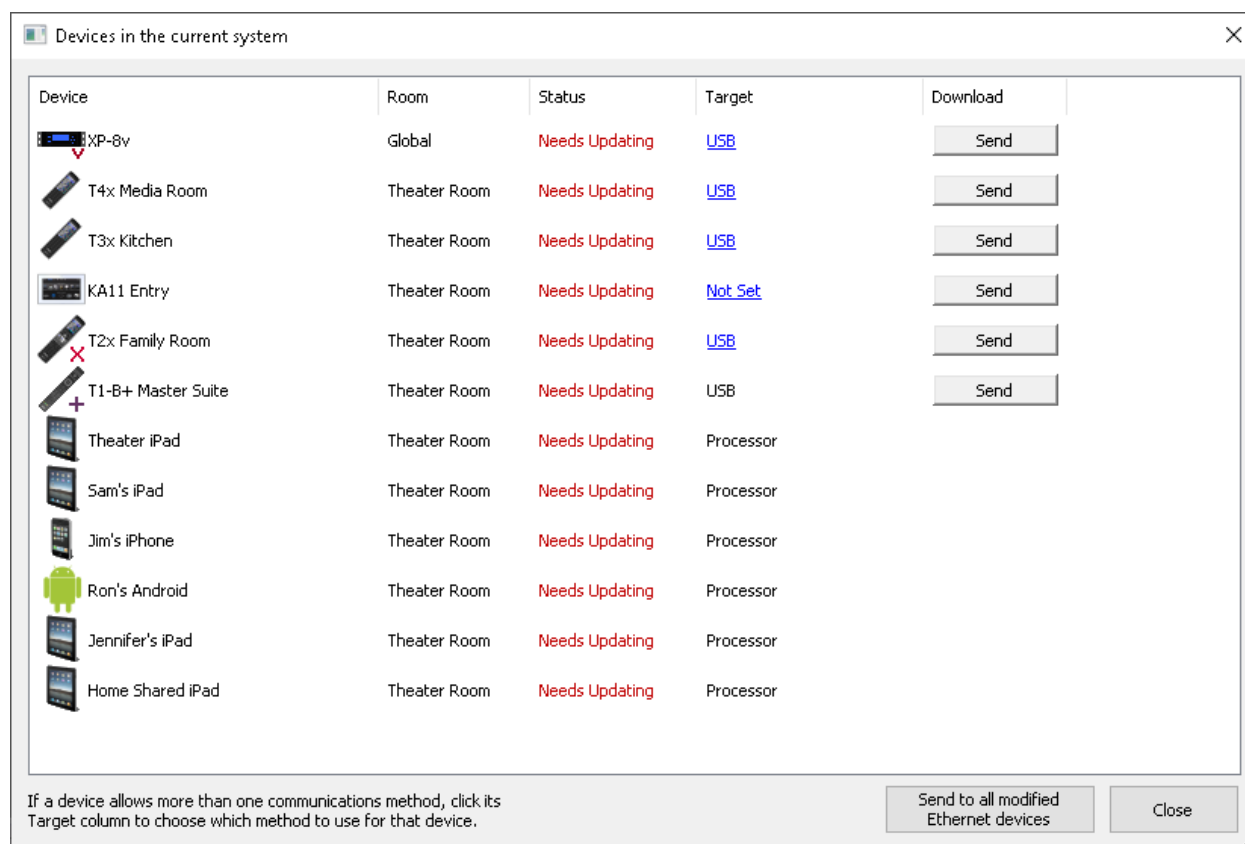

The screenshot shows the 'Layer Properties' dialog box with the 'Visible' field set to 'Flag 1: Bathroom Menu Popup (Local Flags\Flags)'. Below the field is a note: 'Note: Layer visibility overrides the visibility set on individual buttons on the layer.' There are checkboxes for 'Locked' and 'Shared', both of which are unchecked. At the bottom are 'OK' and 'Cancel' buttons.

- Added a "Compact File" menu option.

- The RTiPanel devices are now shown in the download list. They still download with the processor, as they were before, but they are being shown in the list so the compile process can be monitored.

Other Enhancements

- Added an option to convert between KA8 and KA11 devices.
- Changed delay macro step to default to the last used delay value.
- The text field in the variables dialog is disabled unless a text tag is selected.
- It now defaults to the previously selected driver when opening the layer visibility variable dialog.

Bug Fixes

- Fixed: Controller macros and variables don't work in viewports
- Fixed: Controller macros and variables don't work in viewports.
- Fixed: With larger files, there can be a long delay after adding a controller.
- Fixed: Driver events aren't imported from bundles correctly.
- Fixed: Imagelist bitmaps weren't being imported from bundles.
- Fixed: Variables aren't being mapped correctly from one zone from another when imported from a bundle.
- Fixed: Page links to Next/Previous Page in Group were not being imported from a bundle.
- Fixed: Icon overlay sometimes draws as black rather than the selected color.
- Fixed: Undo doesn't delete copied button after Ctrl-dragging a button.
- Fixed: Location info in the processor properties was missing.
- Fixed: The tag list sometimes isn't in sync with the selected layer.
- Fixed: The ports tab wasn't visible for KX3 processor.
- Fixed: Issues with tab order and other keyboard issues.
- Fixed: Page transparent property wasn't being saved.
- Fixed: A remote control could sometimes show that it needs update even when nothing has changed.
- Fixed: Crash when duplicating a button.
- Fixed: In some cases, a driver command would show up as unknown when downloaded to the processor.
- Fixed: Database error when starting APEX.
